=====

The SOFT-ROM is a 16K RAM board which uses the same memory space as the Spectrums internal ROM. Once loaded with the Sinclair operating system ( or even your own! ) the Spectrum's ROM is disabled leaving you with a 64K RAM computer.

The uses to which a SOFT-ROM can be put are only limited by the skill and ingenuity of the programmer. Some of them may include the following :-

Change the RESET code at 0 to give an ESCAPE Function  
Use the non-maskable interupt (NMI) to stop programs.  
Alter the SAVE/LOAD routines for other baud rates.  
Addition of extra commands e.g. Hex notation.  
etc. etc.

Switching between the Sinclair ROM and the SOFT-ROM RAM is by switch on the unit labelled NORM/SOFT.

To protect the software held in SOFT-ROM a WRITE DISABLE is included. This has been found necessary as parts Sinclair operating swstem overwrites itself!

Other Features included on the unit are RESET and NMI switches which have the following functions :-

RESET

On delivery this switch is set up to take the RESET line to the Z80 low for as long as the switch is in the RESET position. To avoid memory corruption ( see notes an Dynamic RAMs ) the small red link on the underside of the SOFT-ROM may be removed and the 1uF capacitor (C27) internal to the Spectrum also removed to allow a short pulse RESET of approximately 12 uS to be used.

NMI

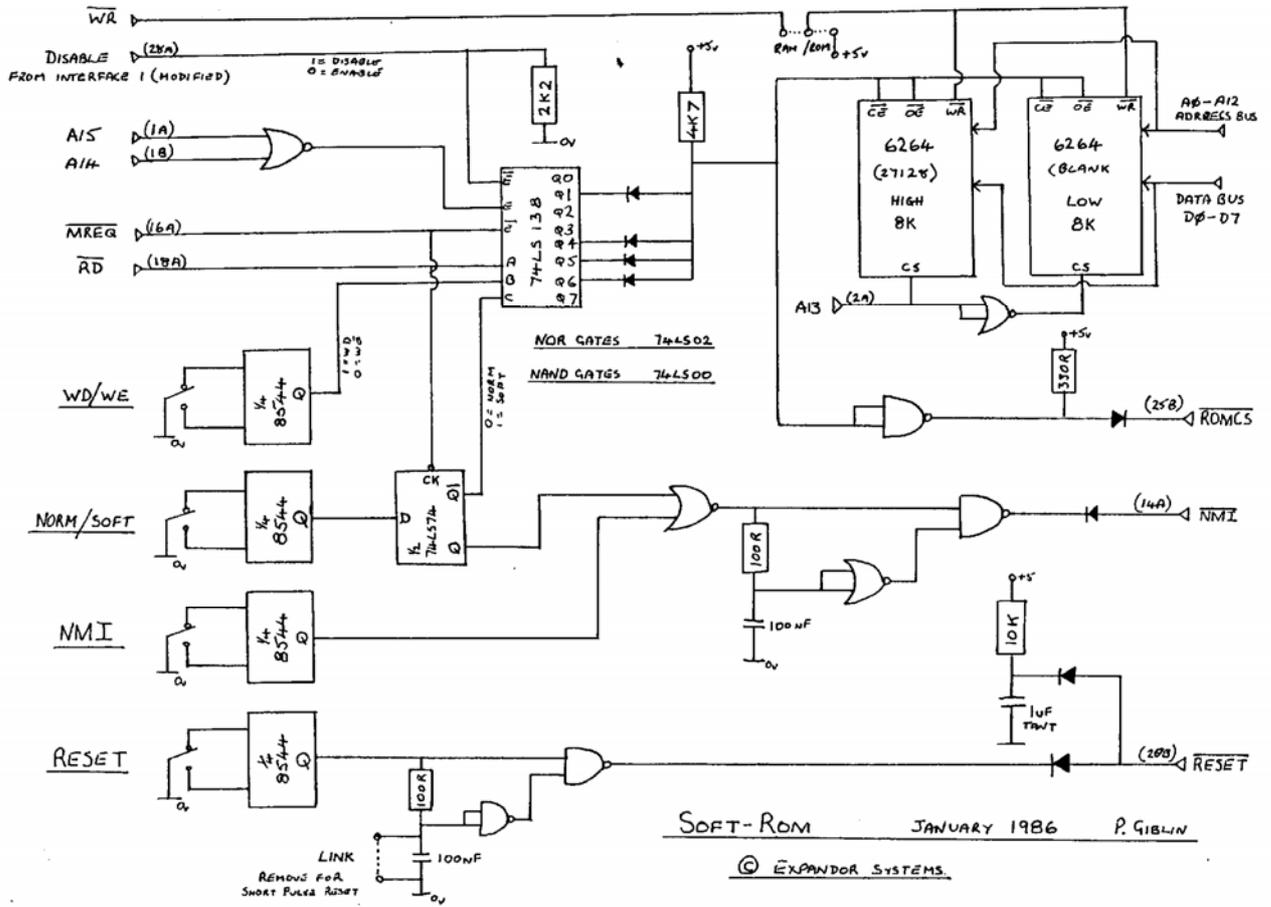

This switch will not generate a non-maskable interrupt with the SOFT-ROM in the NORM mode as this would serve no useful purpose. When in SOFT mode, activation will cause an interrupt to be serviced.

Also, there is the facility to generate an NMI, at the instance of change over from NORM to SOFT, by switching to NMI while in NORM mode, when the switch over, is made there will be an automatic jump to 66h.

The SOFT-ROM will operate with Interface 1 but as it uses the ROMCS line to disable the internal Spectrum ROM, the SHADOW ROM is also disabled. Therefore, no Microdrive commands etc. can be used when in SOFT mode. Interface 1 will Function as normal when the SOFT-ROM is switched to NORM. There is a hardware fix to this problem requiring a small modification to Interface 1 (details available).

=====

USING THE SOFT-ROM

=====

With each SOFT-ROM there is a tape containing a SOFT-ROM handling utility program. If you are a first time user of a SOFT-ROM please follow these instructions carefully.

Step 1. Switch off the power to the Spectrum.

2. Plug the SOFT-ROM into the Spectrums expansion port.

3. Put the Four switches on the SOFT-ROM to :-

WD NORM OFF OFF

4. Re-connect the power to the Spectrum and verify that it is working as NORMal.

5. Load the supplied tape by LOAD "softrom". When the program has loaded you will be presented with the following menu :-

1. Load SOFT-ROM code from TAPE
  2. Load SOFT-ROM code from MICRODRIVE
  3. Save SOFT-ROM code to TAPE
  4. Save SOFT-ROM code to MICRODRIVE
  5. Test the SOFT-ROMs RAM and copy the Sinclair ROM
  6. Save this program to TAPE
  7. Save this program to MICRODRIVE
6. Select option 5 and follow the screen instructions.
7. Return to the main menu.
8. Select option 2 and load in the block of CODE which follows the main program on the tape. This is 16K of CODE and is an example of an altered operating system. Its filename For loading is "ROM" (see ROM details).

The other options are straightforward and easy to use by following the screen prompts.

Interface 1 users may experience the occasional crash on switching from SOFT to NORM. This is probably caused by the paging system of Interface 1 getting confused. The answer to this problem is to modify Interface 1, or to execute a PAUSE 0 command then switch over and press BREAK.

PLEASE REMEMBER NEVER TO CONNECT OR REMOVE THE SOFT-ROM WITH THE POWER SWITCHED ON AS DAMAGE TO BOTH THE SPECTRUM AND THE SOFT-ROM INVARIABLY OCCURS.

=====

ROM DETAILS

=====

The SOFT-ROM code supplied on the tape is an altered version of the Sinclair operating system and has the following changes incorporated :-

- a) The Non-Maskable Interrupt (NMI) service routine at 0066h has been altered to give an ESCAPE function from a crash. The normal error routine is used so programs which change the ERR-SP system variable will cause problems.
- b) The RESET code at location 0000h will perform a NEW rather than a total memory clear. BASIC programs will be lost.
- c) Hexadecimal notation has been implemented (see separate sheet for listing).
- d) The LOAD routine at 0556h will also print to the screen the starting address and the length of the code block after the program name.
- e) The default colour attributes are black paper and white ink.

With the SOFT-ROM loaded with "ROM" and switched to SOFT, enter BEEP 10,10 and while the note is sounding activate NMI. This demonstrates the ability to break out of an otherwise uninterruptable loop.

Try using the Hexadecimal notation wherever a number can be used e.g. SAVE "filename" CODE &B000,&E8A  
RANDOMIZE USR &FCOO

Included on the tape (after, the "ROM" code) is a text file to be loaded into the Hisoft "GENS" assembler and has the filename of "GENSFILE". This file has all the changes made to produce "ROM" listed.

DYNAMIC RAM MEMORIES AND RESET

On the Spectrum as supplied From Sinclair, the power on RESET is approximately 200mS long. This is far too long for the REFRESH of the 32K Dynamic memory to be maintained. Refresh will be suspended for as long as RESET is held low. Therefore if the CODE at location 0000h is to be changed to allow RESET to have other functions then a short pulse, less than 2mS must be used. By removing the 1uF capacitor ( C27 ) INSIDE the Spectrum and removing the small red link under the SOFT-ROM this will be achieved. You will then be able to use RESET without corrupting memory.

INTERFACE 1 MODIFICATIONS

=====

The SOFT-ROM is incompatible with Interface 1. The reason for this is that when the SOFT-ROM is paged in both the INTERNAL SPECTRUM ROM and the SHADOW ROM in Interface 1 are disabled and although the SOFT-ROM will still function, no Interface 1 functions will be available when in SOFT mode.

The answer to the problem is to use the ROMCS line from Interface 1 to temporarily page out the SOFT-ROM. This can be achieved by diverting ROMCS to the spare edge connector pad 28A, which is now a disable line on the SOFT-ROM.

THIS MODIFICATION MAY INHIBIT OTHER ROM BASED EQUIPMENT!

The modification steps are :-

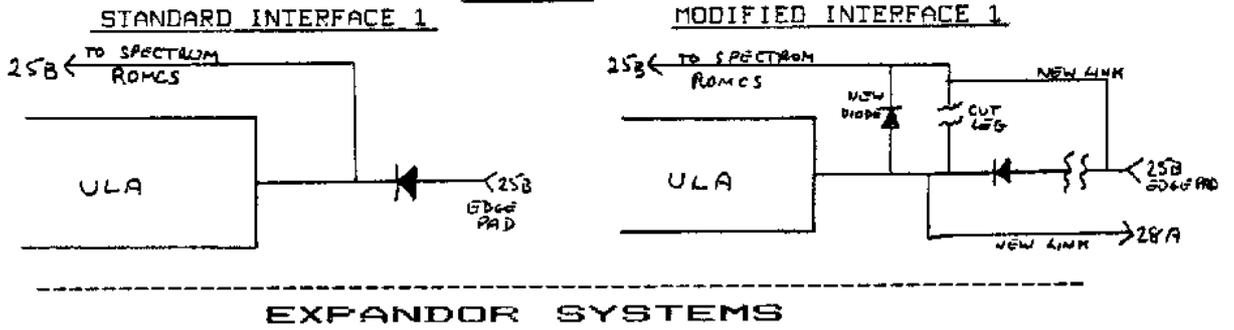

- (a) Cut out a small section of the PCB track to the edge pad 25B (underside at rear of Interface 1).
- (b) Cut the leg of the edge connector to 25B into the Spectrum (be careful not to bend the 'A' row too far to reach the 'B' row).
- (c) Make a wire connection from the 25B pad to the Spectrum side of the cut 25B leg and insulate.
- (d) Make a wire connection from the bottom part of the 25B leg (solder point under PCB) to pad 28A on the top side rear of the PCB.
- (e) For Interface 1 to work without the SOFT-ROM in place mount a DIODE (1N4148 only) to bridge the cut leg 25B.
- (f) Check your work being especially careful to remove any solder splashes or bridges as it is very easy to damage both the Interface 1 and the Spectrum!

HEXADECIMAL NOTATION FOR THE SPECTRUM WITH SOFT-ROM

=====

Format for use :-

The symbol '&' is placed before the hexadecimal number and the Spectrum will then accept it as a valid number in circumstance where a number is expected by the syntax check.

e.g. PRINT &FA + &A/200  
SAVE "NAME" CODE &E01B,&A2C

```

1      ENTRY          ORG   #3870
2              CP     #C4      Test for BIN
3              JR     NZ,NOTBIN  Jump if no
4              JP     #2C9F     yes, do BIN
5  NOTBIN          CP     #26      test for "&"
6              JP     NZ,#2CB8   no, then do number
7
8              LD     DE,#0      Clear previous data
9              LD     (#FFFE),DE  from spare location
10             LD     HL,#2CB3    Preset stack for
11             PUSH  HL          return
12
13  HEXCONV        RST   #20      Get next character
14             CALL  TEST        Go test for valid
15             RET   NC          HEX digit. NC = error
16             LD   HL,#FFFE     Now do HEX conversion
17             RLD                going round the loop
18             LD   E,(HL)        until a non-HEX digit
19             INC  HL            is found.
20             RLD                Exit with decimal
21             LD   D,(HL)        number in DE
22             JR   HEXCONV
23
24  TEST          CALL  #2D1B     Test for number
25             JR   NC,NUMBER    NC = number OK
26             CALL  #2C8D     Test for letter
27             RET   NC          NC = error
28             AND  #DF          convert to upper case
29             CP   #47          Test for 'G' upwards
30             RET   NC          NC = error
31             SUB  #7           Convert from ASCII to
32  NUMBER        SUB   #30      decimal
33             SCF                Return with carry set
34             RET                to flag OK.
35 ; ROM PATCHES
36             ORG   #2C9B
37             JP   #3870        Jump to HEX routine
38             ORG   #267B        Use 'POINT' routine
39             JR   #2C8D        to jump to number
40             ORG   #25AC
41             DEFB  #26          Change 'point' to '&'

```

-----
